

```
import processing.pdf.*;
boolean savePDF = false;

void setup() {
    size(400, 400);
    fill(255);
    smooth();
    background(255);
}

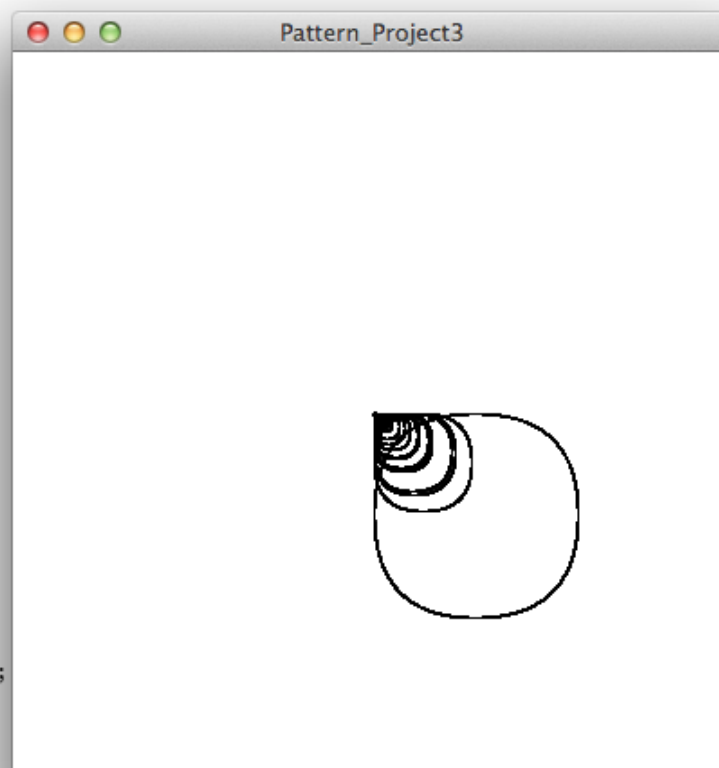

void draw() {
    if ( savePDF ) {
        beginRecord ( PDF, "pdf/myartwork-###.pdf" );
    }

    String[] data = loadStrings("data.txt");
    println(data);

    noFill();
    for (int y = 10; y < 50; y++) {
        rect(200, 200, int(data[y]), int(data[y]), int(data[y]));
    }

    noFill();
    if (savePDF) {
        endRecord();
        savePDF = false;
    }
}

void keyPressed()
{
    if (key == 's' ) {
        savePDF = true;
    }
}
```

In this project I developed a pattern using Processing software by inputting data collected from my tumblr followers for a two week period.

The pattern show on the previous spread served as inspiration for the paper neckbrace and sleeves created using intervals from the data collected.

all-nighters

# 4

all-nighters

Recently there's been an increased awareness of the strained mental health of architecture students. It is implied and sometimes expected that architecture students pull constant all-nighters to finish multiple deadlines. In fact, some professors expect students to stay up all night working on projects by default. To convey the message several students were traced using chalk with the intent of symbolizing a crime scene along with a small sign that explained how many all-nighters were incurred before the "incident" occurred. The goal was to portray several situations where individuals suffered fatal accidents due to lack of sleep.
